## **1. Overview**

This document explains how to test the devices(NVMe M.2, DDR4 DIMM, PCIe x16 endpoint, QSFP28) mounted on DAISY.

## 2. Test Setup

Set mode select dip switch[SW1] to [JTAG / QSPI / SD] mode accordingly.

MODE	Switch			
	[4]	[3]	[2]	[1]
<b>JTAG</b>	LOW[ON]	LOW[ON]	LOW[ON]	LOW[ON]
<b>QSPI 32</b>	LOW[ON]	LOW[ON]	HIGH[OFF]	LOW[ON]
<b>SD1</b>	HIGH[OFF]	HIGH[OFF]	HIGH[OFF]	LOW[ON]

### 3. NVMe M.2

Samsung SM963 NVMe M.2 SSD 480GB MLC has been verified on DAISY.

Insert NVMe M.2 SSD to CR-DAISY-M2EXP1-REV2.1 board.

Connect CR-DAISY-M2EXP1-REV2.1 board to DAISY through J25.

Create bootable image for SD boot or QSPI boot by referring to [DAISY Petalinux Porting Guide](#) document.

Check if LED0 is turned on during boot. LED0 is on if PCIe link is correctly configured.

Verify PCIe link after logging in linux.

```
root@daisy:~# lspci
0000:00:00.0 PCI bridge: Xilinx Corporation Device 9134
0000:01:00.0 Non-Volatile memory controller: Samsung Electronics Co Ltd NVMe SSD
Controller SM961/PM961
0001:00:00.0 PCI bridge: Xilinx Corporation Device 9134
root@daisy:~#
```

Check if NVMe SSD is configured as block device.

```
root@daisy:~# lsblk
NAME                MAJ:MIN RM   SIZE RO TYPE MOUNTPOINT
mtdblock0           31:0    0    36M  0 disk
mtdblock1           31:1    0     1M  0 disk
mtdblock2           31:2    0    68M  0 disk
mtdblock3           31:3    0    11M  0 disk
mmcblk0             179:0    0   14.9G  0 disk
|-mmcblk0p1          179:1    0     1G  0 part /run/media/mmcblk0p1
`--mmcblk0p2          179:2    0    6.5G  0 part /run/media/mmcblk0p2
nvme0n1              259:0    0  447.1G  0 disk
root@daisy:~#
```

Create disk partition.

```
root@daisy:~# fdisk /dev/nvme0n1

Welcome to fdisk (util-linux 2.32.1).
Changes will remain in memory only, until you decide to write them.
Be careful before using the write command.

Device does not contain a recognized partition table.
Created a new DOS disklabel with disk identifier 0xcb728903.

Command (m for help): n
Partition type
   p   primary (0 primary, 0 extended, 4 free)
   e   extended (container for logical partitions)
Select (default p): p
Partition number (1-4, default 1):
First sector (2048-937703087, default 2048):
Last sector, +sectors or +size{K,M,G,T,P} (2048-937703087, default 937703087):

Created a new partition 1 of type 'Linux' and of size 447.1 GiB.

Command (m for help): w
The partition table has been altered.
Calling ioctl() to re-read partition table.
[ 1883.709806] nvme0n1: p1
Syncing disks.
root@daisy:~#
```

## DAISY Device Test Guide

Check new partition name.

```
root@daisy:~# lsblk
NAME                MAJ:MIN RM   SIZE RO TYPE MOUNTPOINT
mtdblock0           31:0    0    36M  0 disk
mtdblock1           31:1    0     1M  0 disk
mtdblock2           31:2    0    68M  0 disk
mtdblock3           31:3    0    11M  0 disk
mmcblk0             179:0    0   14.9G  0 disk
|-mmcblk0p1         179:1    0     1G  0 part /run/media/mmcblk0p1
`-mmcblk0p2         179:2    0    6.5G  0 part /run/media/mmcblk0p2
nvme0n1             259:0    0  447.1G  0 disk
`-nvme0n1p1         259:1    0  447.1G  0 part
root@daisy:~#
```

Make file system on new partition.

```
root@daisy:~# mkfs -t ext2 /dev/nvme0n1p1
mke2fs 1.44.3 (10-July-2018)
Discarding device blocks: done
Creating filesystem with 117212630 4k blocks and 29310976 inodes
Filesystem UUID: 15a30903-8a05-4beb-9971-21cf586f1caf
Superblock backups stored on blocks:
    32768, 98304, 163840, 229376, 294912, 819200, 884736, 1605632, 2654208,
    4096000, 7962624, 11239424, 20480000, 23887872, 71663616, 78675968,
    102400000

Allocating group tables: done
Writing inode tables: done
Writing superblocks and filesystem accounting information: done

root@daisy:~#
```

Create a directory and mount SSD to the directory.

```
root@daisy:~# mkdir /media/nvme
root@daisy:~# mount /dev/nvme0n1p1 /media/nvme
root@daisy:~# cd /media/nvme
root@daisy:/media/nvme# vi test.txt
```

Create a test file and check if the file is preserved during power cycling.

[illegible]

```
root@daisy:/media/nvme# ls -al
total 24

root@daisy:/media/nvme#
```

## 4. DDR4 DIMM

8GB x8 DDR4\_M393A1K43BB0-CRC / 16GB x4 DDR4\_M393A2K40BB1-CRC have been verified on DAISY.

Connect 8GB x8 DDR4\_M393A1K43BB0-CRC RDIMM to J8 and 16GB x4 DDR4\_M393A2K40BB1-CRC RDIMM to J9.

Set SW1 to JTAG mode.

Connect USB cable with host PC.

Connect 12V DC power adaptor.

Turn on board power by sliding power switch.

Open [dual\\_mig\\_x8.zip](#) Vivado project.

Vivado version 2019.1 should be used.

In the Address Editor tab, 8GB RDIMM is mapped to 0x1000000000

and 16GB RDIMM is mapped to 0x18000000000.

Cell	Slave Interface	Base Name	Offset Address	Range	High Address
zynq_ultra_ps_e_0					
Data (40 address bits : 0x00A0000000 [ 256M ], 0x0400000000 [ 4G ], 0x1000000000 [ 224G ])					
ddr4_0	C0_DDR4_S_AXI	C0_DDR4_ADDRESS_BLOCK	0x10_0000_0000	8G	0x11_FFFF_FFFF
ddr4_0	C0_DDR4_S_AXI_CTRL	C0_REG	0x00_A000_0000	4K	0x00_A000_0FFF
ddr4_1	C0_DDR4_S_AXI	C0_DDR4_ADDRESS_BLOCK	0x18_0000_0000	16G	0x1B_FFFF_FFFF
ddr4_1	C0_DDR4_S_AXI_CTRL	C0_REG	0x00_A000_1000	4K	0x00_A000_1FFF

Select "Open Hardware Manager" under "PROGRAM AND DEBUG" in "Flow Navigator".

Click "Program device".

Verify if LED0 and LED1 are turned on after FPGA is programmed.

Two LEDs must be turned on if MIG calibration is done correctly.

Run serial terminal to view debug log.

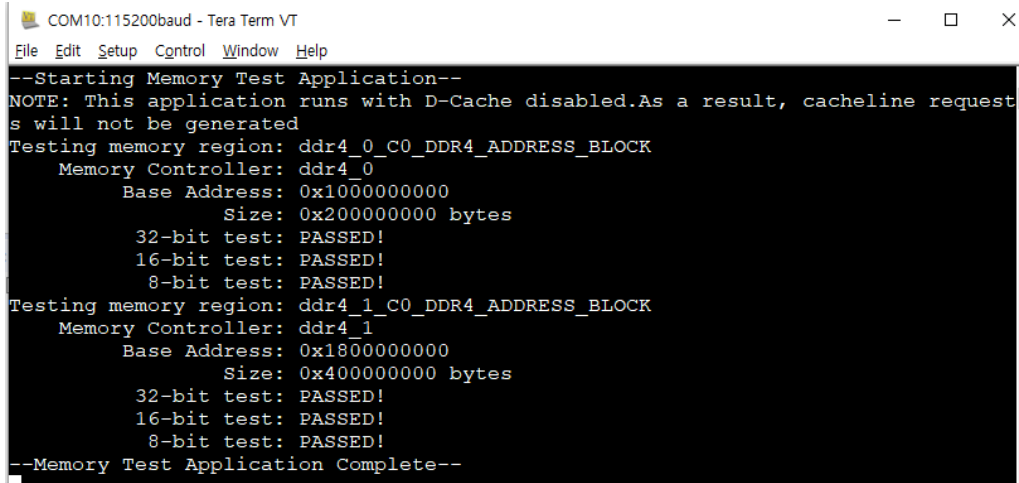

Launch SDK through "File" -> "Launch SDK" to check if RDIMM can be accessed.

Select "Run" -> "Debug History" -> "System Debugger on Local" on SDK menu.

Verify if two LEDs are turned on after FPGA is programmed.

Click Cortex-A53 #0 and press "F8" to execute the program.

Check if memory test passes.

```

```

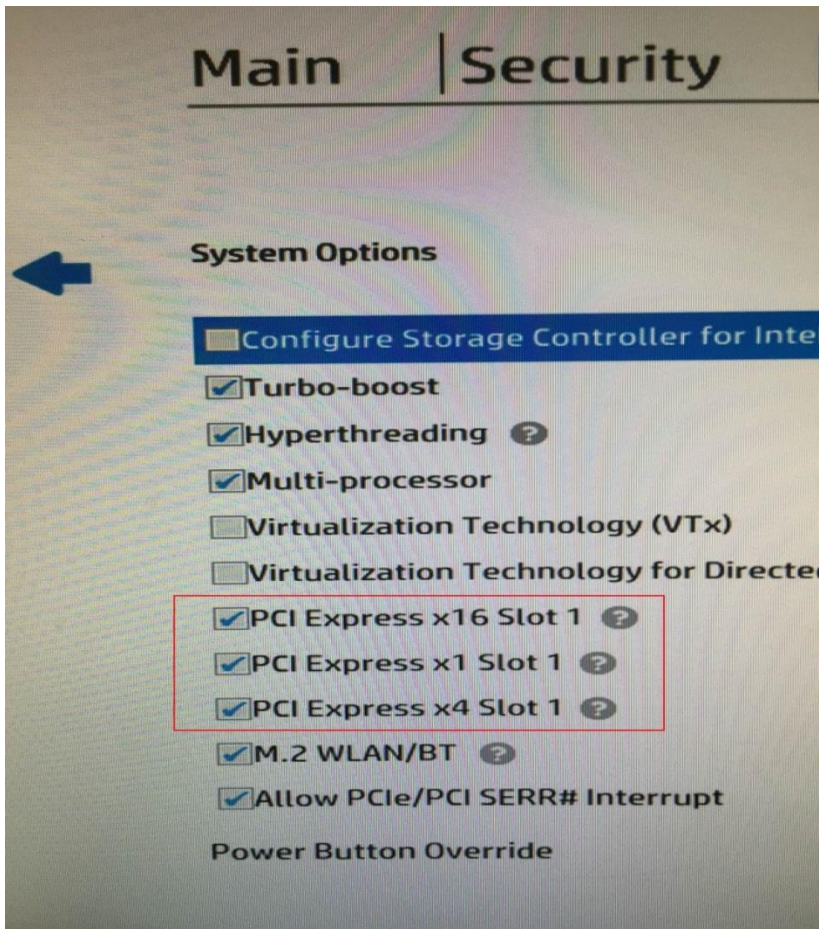

## 5. PCIe x16 Endpoint

During the test, set the Mode Select DIP Switch[SW1] to JTAG mode.

### 5.1. PCIe Host BIOS Setup

PCIe slot must be enabled in PCIe Host BIOS setup.

The host used for verification is HP PRODESK, and the PCIe slot must be activated in the BIOS as shown below.

### 5.2. Verifying the PCIe link

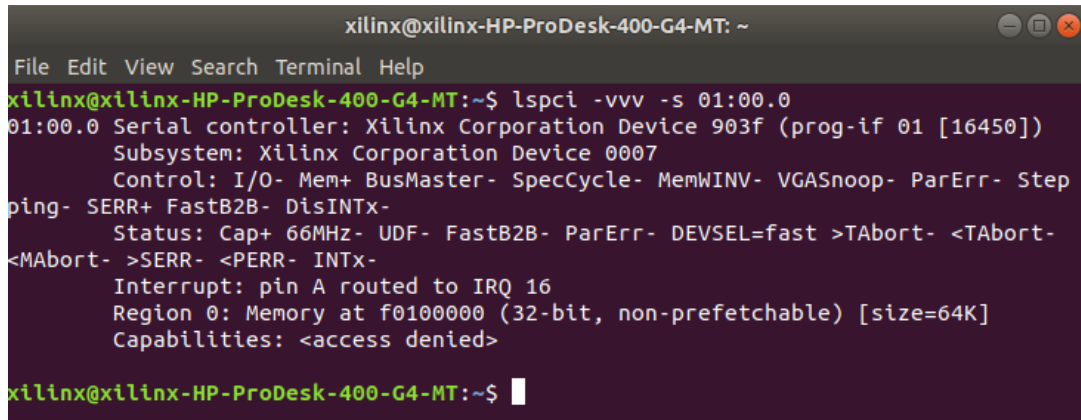

After attaching the PCIe extension cable to the Daisy board, plug it into the PCIe x16 slot of PRODESK (it is the top black slot among the three PCIe slots).

Apply 12V power to the board.

Open the provided Vivado project ([pcie\\_ep.zip](#)) and download the bitstream.  
Vivado 2019.1 version must be used.

Power on PRODESK and log in to Linux.  
At this time, check if LED0 of the board is on.

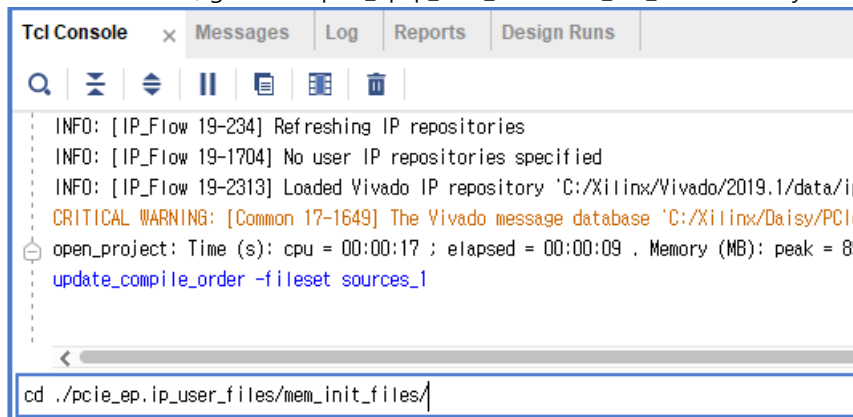

After logging in to Host Linux, run the command below from the command line to check if the link is established.

```
xilinx@xilinx-HP-ProDesk-400-G4-MT: ~
File Edit View Search Terminal Help
xilinx@xilinx-HP-ProDesk-400-G4-MT:~$ lspci -vvv -s 01:00.0
01:00.0 Serial controller: Xilinx Corporation Device 903f (prog-if 01 [16450])
    Subsystem: Xilinx Corporation Device 0007

    Capabilities: <access denied>
xilinx@xilinx-HP-ProDesk-400-G4-MT:~$
```

The following is how to verify the PCIe link on the vivado tool. It must be executed with the board and JTAG connected.

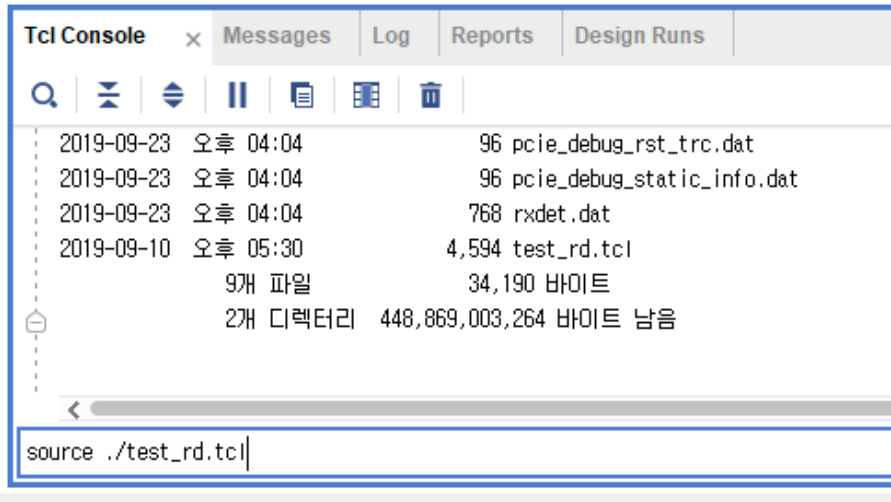

In the Tcl Console, go to the pcie\_ep.ip\_user\_files/mem\_init\_files directory.

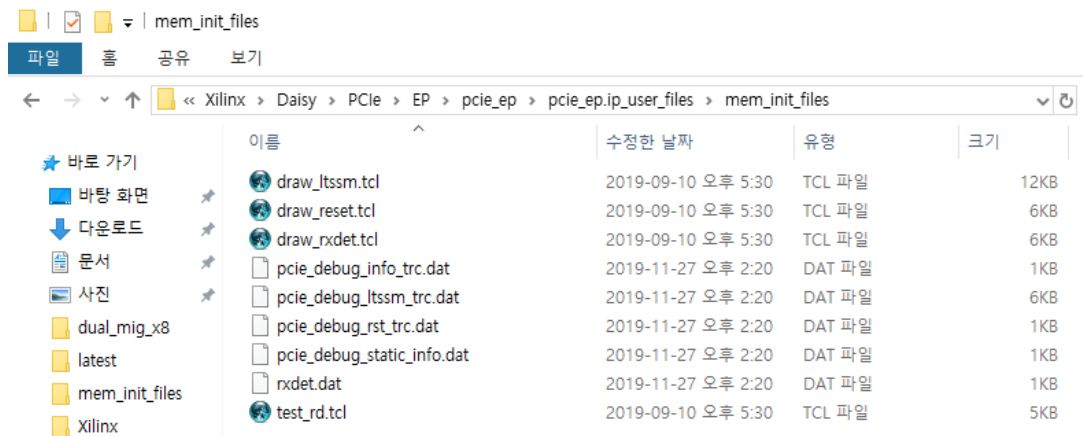

```
Tcl Console x Messages Log Reports Design Runs

```

## DAISY Device Test Guide

Run test\_rd.tcl.

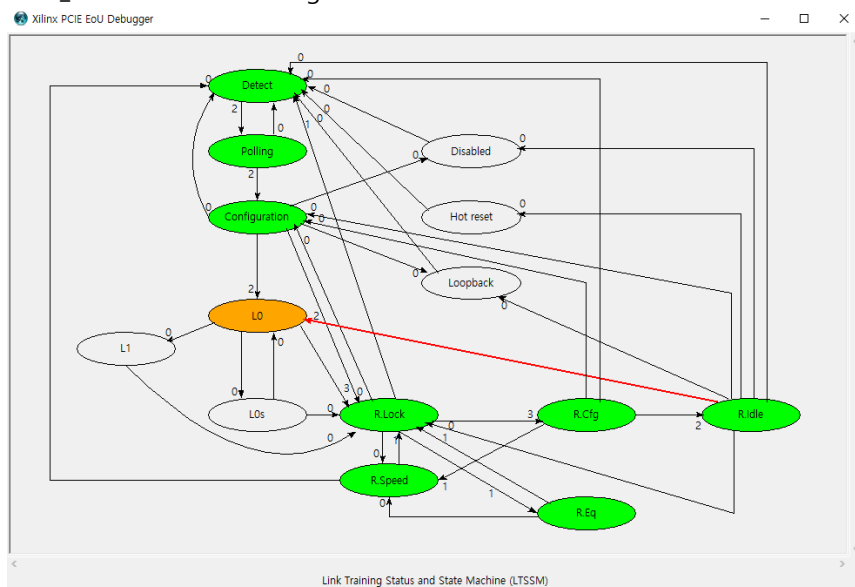

You can see that five dat files such as pcie\_debug\_info\_trc.dat, pcie\_debug\_ltssm\_trc.dat, pcie\_debug\_rst\_trc.dat, pcie\_debug\_static\_info.dat and rxdet.dat have been newly created.

## DAISY Device Test Guide

draw\_ltssm.tcl – Link training status and state machine are also normal.

In the Serial I/O Links tab, click Create Scan...

Name	TX	TX Pre-Cursor	TX Post-Cursor	TX Diff Swing	DFE Enabled
Ungrouped Link

### 5.3. XDMA test

Access the following link and copy the necessary files to Ubuntu 16.04 Host.

[https://github.com/Xilinx/dma\\_ip\\_drivers](https://github.com/Xilinx/dma_ip_drivers)

Run the following command to build the XDMA driver kernel module and application program.

```
$ cd XDMA/linux-kernel
```

```
$ cd xdma
```

```
$ make install
```

```
$ cd tools
```

```
$ make
```

```
$ cd tests
```

Load the XDMA kernel module.

```
$ sudo ./load_driver.sh
```

Test whether XDMA is operating normally.

```
$ ./run_test.sh
```

```
xilinx@xilinx:~/Downloads/dma_ip_drivers-master/XDMA/linux-kernel/tests$ sudo ./run_test.sh

## 6. QSFP28 - 100GB Ethernet

Write [daisy\\_202001\\_20200721\\_image.tgz](#) to the microSD card.

Boot two DAISY boards with microSD card and connect the QSFP28#1 channels to each other with 100GB 1m copper cable.

Set ip and mtu size in eth1 on board 1.

```
root@daisy:~# ifconfig eth1 down
root@daisy:~# ifconfig eth1 mtu 8192
root@daisy:~# ifconfig eth1 192.168.2.1 up
```

Set ip and mtu size in eth1 on board 2.

```
root@daisy:~# ifconfig eth1 down
root@daisy:~# ifconfig eth1 mtu 8192
root@daisy:~# ifconfig eth1 192.168.2.2 up
```

On boards 1 and 2, ping to see if the other party's ip is connected.

```
root@daisy:~# ping 192.168.2.1
PING 192.168.2.1 (192.168.2.1): 56 data bytes
64 bytes from 192.168.2.1: seq=0 ttl=64 time=0.167 ms
